1 Introduction

The study carried on in this paper draws its motivation from the problem of the asymptotic description of nonlinearly elastic thin films with a fast-oscillating profile. The behaviour of such films is governed by an elastic energy, where two parameters intervene: a first parameter ε represents the thickness of the thin film and a second one δ the scale of the oscillations. The analytic description of the elastic energy is given by a functional of the form

$$E_{\varepsilon,\delta}(u)=\int_{\Omega(\varepsilon,\delta)} W(Du)\,dx, \tag{1.1}$$

where the set $\Omega(\varepsilon,\delta)$ is of the form

$$\Omega(\varepsilon,\delta)=\Big\{x\in\mathbb{R}^3:\ |x_3|<\varepsilon\, f\Big(\frac{x_1}{\delta},\frac{x_2}{\delta}\Big),(x_1,x_2)\in\omega\Big\}, \tag{1.2}$$

with f is a bounded 1-periodic function which parameterizes the boundary of the thin film, which then has periodicity δ. It is convenient to scale these energies by a change of variables and consider the functionals

$$E^{\delta}_{\varepsilon}(u)=\int_{\Omega(\delta)} W\Big(D_1u,D_2u,\frac{1}{\varepsilon}D_3u\Big)\,dx, \tag{1.3}$$

where now

$$\Omega(\delta)=\Big\{x\in\mathbb{R}^3:\ |x_3|<f\Big(\frac{x_1}{\delta},\frac{x_2}{\delta}\Big),(x_1,x_2)\in\omega\Big\}. \tag{1.4}$$

In this way we separate the effects of the two parameters ε and δ.

In a recent paper by Braides, Fonseca and Francfort [8] a general compactness result for functional of thin-film type has been proven which comprises energies of the form (1.3), showing that, with fixed $\delta=\delta(\varepsilon)$, upon possibly extracting a subsequence, the family $E^{\delta(\varepsilon)}_{\varepsilon}$ converges in the sense of De Giorgi's Γ-convergence as $\varepsilon \to 0$ to a 2-dimensional energy, which, if $\delta(\varepsilon) \to 0$ as $\varepsilon \to 0$, can be identified with a $2d$-functional of the form

$$E(u) = \int_\omega \widetilde{W}(D_1 u, D_2 u)\,dx. \tag{1.5}$$

In many cases it is possible to describe $\widetilde{W}$ explicitly in terms of W and f, and as a consequence to prove that no passage to a subsequence is necessary. When $f = C$ is constant (*i.e.*, the profile of the thin film is flat, and hence there is no real dependence on δ) the description of the energy density $\widetilde{W}$ has been given by Le Dret and Raoult [19] who proved that $\widetilde{W} = 2C\,Q_2\overline{W}$; here Q_2 denotes the operation of $2d$-quasiconvexification, and $\overline{W}$ is obtained from W by minimizing in the third component. An equivalent formula, of 'homogenization type', is given in [8] (see also [6]). If $\overline{W} \neq Q_2\overline{W}$ (*i.e.*, $\overline{W}$ is not quasiconvex) then both formulas underline the formation of microstructures generated by the passage to the limit. When f is not constant, then the function $\widetilde{W}$ depends on the behaviour of δ with respect to ε. The case when $\delta = \varepsilon$ (or more in general when δ/ε converges to a constant) has been treated in [8], where it is shown that a homogenization type formula for $\widetilde{W}$ can be given. The same method can be used when $\delta >> \varepsilon$; in this case the recipe to obtain $\widetilde{W}$ is the following: first, keep δ fixed and apply the Le Dret and Raoult procedure, considering the thickness of the thin film as a parameter. The output of this procedure is a 2-dimensional energy of the form

$$E^\delta(u) = \int_\omega 2f\Big(\frac{x_1}{\delta}, \frac{x_2}{\delta}\Big) Q_2\overline{W}(D_1 u, D_2 u)\,dx. \tag{1.6}$$

We can then let δ tend to 0, and apply well-known homogenization procedures (see [6]) obtaining a limit functional, which turns out to be the desired one. In the case $\delta << \varepsilon$ it is possible to make an *ansatz* in the same spirit, arguing that the limit E can be obtained in the following two steps:

(1) (Homogenization of sets with oscillating boundaries) First consider ε as fixed, and let $\delta \to 0$, to obtain a limit functional of the form

$$E_\varepsilon(u) = \int_{\omega\times(-1,1)} W_{\rm hom}\Big(x_3, D_1 u, D_2 u, \frac{1}{\varepsilon} D_3 u\Big)\,dx$$

(we consider the normalized case $\sup f = 1$).

Note that in this case an additional dependence on x_3 is introduced, which may underline a loss of coerciveness of the function $W_{\rm hom}$ for certain values of x_3. The form of $W_{\rm hom}$ will depend on W and on the sublevel sets of f;

(2) (Thin film limit) Let $\varepsilon \to 0$ and generalize the method of [8] to non-coercive functionals. In this way we obtain a limit energy density

$$\begin{aligned}\overline{W}_{\rm hom}(\overline{F}) \quad = \quad & \inf_{k\in\mathbb{N}} \inf\Big\{ \frac{1}{k^2} \int_{(0,k)^2\times(0,1)} W_{\rm hom}(x_3, Du + (\overline{F}, 0))\,dx : \\ & \qquad u \in {\rm W}^{1,p}_{\rm loc}((0,1)^3;\mathbb{R}^3),\ u\ k\text{-periodic in}\,(x_1,x_2)\Big\}.\end{aligned}$$

Note that the dependence on x_3 implies that the simpler method of [19] cannot be applied to this situation.

A partial result in this case has been obtained by Kohn and Vogelius [20] who dealt with linear operators.

The purpose of this work is twofold. First, we give a general theory for the homogenization of non-convex energies defined on sets with oscillating boundaries by generalizing the application of the direct methods of Γ-convergence to homogenization as described in [6]. We clarify and prove statement (1) above, by showing that the functionals E_ε are defined on a 'degenerate Sobolev Space' that can be described by proving an auxiliary convex-homogenization result. The formula for $W_{\rm hom}$ can be obtained by solving a possibly degenerate localized $3d$-homogenization problem. In the case of convex W the determination of $W_{\rm hom}(t,\overline{F})$ for fixed $t \in (-1,1)$ essentially amount to solving a $2d$-homogenization problem with an energy which is coercive only on the set $E_t = \{(x_1,x_2) \in \mathbb{R}^2 : f(x_1,x_2) > |t|\}$, while in the general non-convex case the problem defining $W_{\rm hom}(t,\overline{F})$ is genuinely three dimensional. We state and prove these results in a general n-dimensional setting (for some related problems in the convex setting see *e.g.* [9]).

The second goal of the paper is to prove that by following steps (1) and (2) above we indeed obtain the description of $\widetilde{W}$. Even though this is an intrinsically vectorial problem, and hence the 'natural' structural condition on W is quasiconvexity, we have been able to prove this result only with the additional hypothesis that W is convex. The technical point where this assumption is needed is the separation of scales argument, which assures that, essentially, homogenization comes first, followed by the thin film $3d$–$2d$ limit. In general problems where only quasiconvexity is assumed this point is usually proved by a compactness argument which uses some equi-integrability properties of gradients of optimal sequences for the homogenization derived from the growth conditions on the energy density (see *e.g.* Fonseca Müller Pedregal [17]; for the use of this argument in the framework of iterated homogenization see [6] Chapter 22; for an application to heterogeneous thin films with flat profile see Shu [23]). In the case of thin films with fast-oscillating profiles, this technique cannot be used since we have a control on the gradients of optimal sequences only on varying wildly oscillating domains. In the convex case though, optimal sequences for the homogenization can be obtained simply by scaling one single periodic function, and hence their gradients automatically enjoy equi-integrability properties. Note that this difficulty is similar to those encountered when dealing with higher-order theories of thin films. In that case the necessary compactness properties can be obtained by adding a small perturbation with higher-order derivatives (as in the paper by Bhattacharya and James [3]). We do not follow this type of argument since even a singular perturbation by higher-order gradients might interact with the homogenization process, as shown by Francfort and Müller [18]. More applications of Γ-convergence arguments to thin films theory can be found in [2, 7].

2 Notation and Preliminaries

In the sequel, $n, m \in \mathbb{N}$ with $n \geq 2$, $m \geq 1$. If $x \in \mathbb{R}^n$ then $x_\alpha = (x_1, \ldots, x_{n-1}) \in \mathbb{R}^{n-1}$ is the vector of the first $n-1$ components of x, and $D_\alpha = \left(\frac{\partial}{\partial x_1}, \ldots, \frac{\partial}{\partial x_{n-1}}\right)$. If Ω is a open subset of $\mathbb{R}^n$ we denote by $\mathcal{A}(\Omega)$ the family of all open subsets of Ω.

The notation $\mathbb{M}^{m\times n}$ stands for the space of $m \times n$ matrices. Given a matrix $F \in \mathbb{M}^{m\times n}$, and following the notation introduced in [19], we write $F = (\overline{F}|F_n)$, where F_i denotes the i-th column of F, $1 \leq i \leq n$, and $\overline{F} = (F_1, \ldots, F_{n-1}) \in \mathbb{M}^{m\times n-1}$ is the matrix of the first $n-1$ columns of F. $\overline{F}$ denotes also $(\overline{F}, 0)$ when no confusion arises.

The *characteristic function* of a set $E \subset \mathbb{R}^n$ is denoted by χ_E, and the N-dimensional Lebesgue measure in $\mathbb{R}^N$ is designated as $\mathcal{L}^N$. We use standard notation for Lebesgue and Sobolev spaces. The letter c will stand for an arbitrary fixed strictly-positive constant.

We recall the definition of De Giorgi's Γ-*convergence* in L^p spaces, $1 \leq p < +\infty$. Given a family of functionals $J_j : \mathrm{L}^p(\Omega; \mathbb{R}^m) \to [0, +\infty)$, $j \in \mathbb{N}$, for $u \in \mathrm{L}^p(\Omega; \mathbb{R}^m)$ we define

$$\Gamma\text{-}\liminf_{j\to+\infty} J_j(u) = \inf\Big\{\liminf_{j\to+\infty} J_j(u_j) \ : \ u_j \to u \text{ in } \mathrm{L}^p(\Omega; \mathbb{R}^m)\Big\},$$

and

$$\Gamma\text{-}\limsup_{j\to+\infty} J_j(u) = \inf\Big\{\limsup_{j\to+\infty} J_j(u_j) \ : u_j \to u \text{ in } \mathrm{L}^p(\Omega; \mathbb{R}^m)\Big\}.$$

If these two quantities coincide then their common value is called the Γ-*limit* of the sequence (J_j) at u, and is denoted by $\Gamma\text{-}\lim_{j\to+\infty} J_j(u)$. It is easy to check that $l = \Gamma\text{-}\lim_{j\to+\infty} J_j(u)$ if and only if

(a) for every sequence (u_j) converging to u in $\mathrm{L}^p(\Omega; \mathbb{R}^m)$ we have

$$l \leq \liminf_{j\to+\infty} J_j(u_j);$$

(b) there exists a sequence (u_j) converging to u in $\mathrm{L}^p(\Omega; \mathbb{R}^m)$ such that

$$l \geq \limsup_{j\to+\infty} J_j(u_j).$$

We say that (J_ε) Γ-*converges to* l *at* u *as* $\varepsilon \to 0$ if for every sequence of positive numbers (ε_j) converging to 0 there exists a subsequence (ε_{j_k}) for which

$$l = \Gamma\text{-}\lim_{k\to+\infty} J_{\varepsilon_{j_k}}(u).$$

We recall that the Γ-upper and lower limits defined above are L^p-lower semicontinuous functions.

For a comprehensive study of Γ-convergence we refer to the book of Dal Maso [13] (for a simplified introduction see [5]), while a detailed analysis of some of its applications to homogenization theory can be found in [6].

3 The direct method of Γ-convergence

In the sequel we will repeatedly apply some variants of the so-called direct method of Γ-convergence to homogenization problems, which consists in combining localization and integral representation procedures to obtain compactness theorem for classes of integral functional. This method in the version which follows is explained in detail in the book by Braides and Defranceschi [6] (see also Dal Maso [13] and Buttazzo [10]).

Let Ω be a bounded subset of $\mathbb{R}^n$, let $p > 1$ and let $F_\varepsilon : \mathrm{L}^p(\Omega; \mathbb{R}^m) \times \mathcal{A}(\Omega) \to [0, +\infty]$ be a family of functionals of the form

$$F_\varepsilon(u, U) = \begin{cases} \displaystyle\int_U f_\varepsilon(x, Du)\, dx & \text{if } u \in X_\varepsilon(U) \\ +\infty & \text{otherwise,} \end{cases} \tag{3.1}$$

for suitable function spaces $X_\varepsilon(U)$ and $f_\varepsilon : \mathbb{R}^n \times \mathbb{M}^{m\times n} \to [0, +\infty)$ Borel functions. Suppose that there exist Borel functions $g_\varepsilon : \mathbb{R}^n \times \mathbb{R} \to [0, +\infty)$, convex and even in the second variable, with

$$\begin{aligned} g_\varepsilon(x, |F|) &\leq f_\varepsilon(x, F) \leq C(1 + g_\varepsilon(x, |F|)) \leq C(1 + |F|^p), &(3.2)\\ g_\varepsilon(x, 2t) &\leq C(1 + g_\varepsilon(x, t)) &(3.3)\end{aligned}$$

for all $F \in \mathbb{M}^{m\times n}$, $x \in \Omega$ and $t \in \mathbb{R}$. Growth conditions (3.2) and (3.3) are designed to include functions of the type $a_\varepsilon(x)|F|^p$ with the only assumption $a_\varepsilon \geq 0$, thus allowing for zones where $a_\varepsilon = 0$. In the next section a_ε will be the characteristic function of a set with fast-oscillating boundary. Note that a general theory for functions satisfying

$$0 \leq f_\varepsilon(x, F) \leq C(1 + |F|^p)$$

only has not be developed yet. The aim of the direct method of Γ-convergence is to prove a compactness result for the family (F_ε), giving a representation of the limit, and, possibly, complete the description in terms of 'homogenization formulas'.

Step 1 With fixed (ε_j) extract a subsequence (not relabeled) such that $F_\varepsilon(\cdot, U)$ Γ-converges to a functional $F_0(\cdot, U)$ for all U in a dense family of open sets $\mathcal{U}$ (see [6] Proposition 7.9);

Step 2 Thanks to (3.2) and (3.3), prove that $F_0(u, \cdot)$ is the restriction of a finite Borel measure to $\mathcal{U}$ for all $u \in \mathrm{W}^{1,p}(\Omega; \mathbb{R}^m)$, so that by inner regularity we indeed have that $F_\varepsilon(\cdot, U)$ Γ-converges to a functional $F_0(\cdot, U)$ on $\mathrm{W}^{1,p}(\Omega; \mathbb{R}^m)$ for all $U \in \mathcal{A}(\Omega)$. In this step is crucial the so-called *fundamental* L^p*-estimate*: for all $U, Y, Z \in \mathcal{A}(\Omega)$ with $Y \subset\subset U$, and for all $\sigma > 0$, there exists $M > 0$ such that for all $u, v \in \mathrm{W}^{1,p}(\Omega; \mathbb{R}^m)$ one may find a cut-off function $\varphi \in C_0^\infty(U; [0, 1])$, $\varphi = 1$ in Y, such that

$$\begin{aligned} F_\varepsilon(\varphi u + (1 - \varphi)v, Y \cup Z) \leq\ & (1 + \sigma)(F_\varepsilon(u, U) + F_\varepsilon(v, Z)) \\ & + M \int_{(U\cap Z)\setminus Y} |u - v|^p\, dx + \sigma\,. \end{aligned} \tag{3.4}$$

Moreover, by again using the fundamental L^p-estimate it can be proven that if $u \in \mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)\cap X_\varepsilon(U)$ for all ε and $F_0(u,U) < +\infty$ then there exist a sequence $u_\varepsilon \in X_\varepsilon(U)$ such that

$$\lim_{\varepsilon\to 0} F_\varepsilon(u_\varepsilon, U) = F_0(u,U)$$

and $u_\varepsilon = u$ on a neighbourhood of ∂U (see [6] Chapter 11);

Step 3 By the locality and semicontinuity properties of Γ-limits and by Step 2 we can find a function $\varphi : \Omega \times \mathbb{M}^{m\times n} \to [0,+\infty)$ such that $0 \leq \varphi(x,F) \leq C(1+|F|^p)$ and $F_0(u,U) = F_\varphi(u,U)$ for all $u \in \mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$ and $U \in \mathcal{A}(\Omega)$, where

$$F_\varphi(u) = \int_\Omega \varphi(x, Du)\,dx.$$

In the proof of this step a crucial point is the passage from the identity $F_0(u) = F_\varphi(u)$ when u is piecewise affine to a general u by the continuity of F_φ with respect to a convergence in which piecewise-affine functions are dense (*e.g.* the strong $\mathrm{W}^{1,p}$-convergence) (see [6] Chapter 9);

Step 4 If $f_\varepsilon(x,F) = f(\frac{x}{\varepsilon}, F)$ with f 1-periodic in the first variable then by the periodicity of f we deduce that $\varphi = \varphi(F)$ (see [6] Proposition 14.3);

Step 5 If $g_\varepsilon(x,F) = g(\frac{x}{\varepsilon}, F)$ with g 1-periodic in the first variable then we consider the auxiliary functionals

$$G_\varepsilon(u,U) = \begin{cases} \displaystyle\int_U g_\varepsilon(x,Du)\,dx & \text{if } u \in X_\varepsilon(\Omega) \\ +\infty & \text{otherwise.} \end{cases} \tag{3.5}$$

By Step 1–4 we can assume that a function ψ exists such that $G_\varepsilon(\cdot,U)$ Γ-converges to the functional $F_\psi(\cdot,U)$ on $\mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$ for all $U \in \mathcal{A}(\Omega)$;

Step 6 Note that ψ is convex. By an argument of approximation by convolution prove that indeed the functional $G_\varepsilon(\cdot,U)$ Γ-converges to the functional $F_\psi(\cdot,U)$ on $\mathrm{W}^{1,1}(\Omega;\mathbb{R}^m)$ for all $U \in \mathcal{A}(\Omega)$. Define the 'domain' of $F_\psi(\cdot,\Omega)$: $\mathrm{W}^{1,\psi}(\Omega;\mathbb{R}^m) = \{u \in \mathrm{W}^{1,1}(\Omega;\mathbb{R}^m) :\ F_\psi(u,\Omega) < +\infty\}$ (see [6] Theorem 14.8);

Step 7 Repeat Step 2 and 3 substituting the space $\mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$ by the space $\mathrm{W}^{1,\psi}(\Omega;\mathbb{R}^m)$ thus obtaining the representation $F_0 = F_\varphi$ on $\mathrm{W}^{1,1}(\Omega;\mathbb{R}^m)$;

Step 8 Deduce that φ and ψ do not depend on (ε_j) by proving a homogenization formula (see [6] Proposition 21.12);

Step 9 Finally, the representation of F_0 on the whole $\mathrm{L}^p(\Omega;\mathbb{R}^m)$, and not only on $\mathrm{W}^{1,1}(\Omega;\mathbb{R}^m)$, can be obtained in some cases by a more accurate study of the properties of φ.

We will have to modify Steps 1–9 above as to cover the case when the domain of the limit is a 'degenerate Sobolev Space'. In particular, since the function ψ obtained as in Step 5 will be degenerate, a suitable weighted Sobolev Space will have to be defined, which takes the place of $\mathrm{W}^{1,1}(\Omega;\mathbb{R}^m)$ in Step 6 above. Moreover, we will have to deal with the fact that our functions $f_\varepsilon, g_\varepsilon$ may be periodic only in some variables, so that Step 8 will be harder to verify. We will include all the details of the reasonings which do not fall directly in this scheme, while we will feel free to refer to [6] for those procedures which have become customary.

It is worth mentioning that in some cases the arguments outlined above can be simplified by using some techniques (as blow-up arguments or the theory of Young measures) that avoid to use the complex localization procedure. As our problem is concerned those methods seem harder to apply since the energies we consider are coercive only on wildly oscillating sets.

4 Homogenization of media with oscillating profile

Let $f : \mathbb{R}^{n-1} \mapsto [0,1]$ be a 1-periodic lower semicontinuous function and $0 \le \min f \le \sup f = 1$, let $W : \mathbb{R}^{n-1} \times \mathbb{M}^{m\times n} \mapsto [0,+\infty)$ be a Borel function 1-periodic in the first variable satisfying

$$\gamma|F|^p \le W(x_\alpha, F) \le \beta(1+|F|^p) \tag{4.1}$$

for all $x_\alpha \in \mathbb{R}^{n-1}$ and $F \in \mathbb{M}^{m\times n}$, for some $1 < p < +\infty$, $0 < \gamma \le \beta$. The set ω will be a fixed bounded open subset of $\mathbb{R}^{n-1}$ with Lipschitz boundary and $\Omega = \omega \times (-1,1)$.

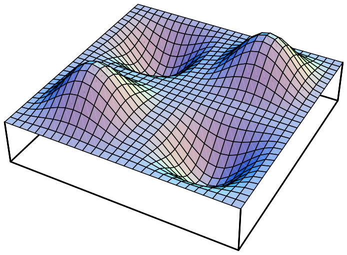

Figure 1: the graph of a typical f in the unit cell

In this section we compute the Γ-limit of functionals of the form

$$J_\varepsilon(u) = \begin{cases} \displaystyle\int_{\Omega_\varepsilon} W\Big(\frac{x_\alpha}{\varepsilon}, Du\Big)\,dx & \text{if } u_{|\Omega_\varepsilon} \in \mathrm{W}^{1,p}(\Omega_\varepsilon;\mathbb{R}^m) \\ +\infty & \text{otherwise,} \end{cases} \tag{4.2}$$

where

$$\Omega_\varepsilon = \{x \in \Omega : \ |x_n| < f(x_\alpha/\varepsilon)\}. \tag{4.3}$$

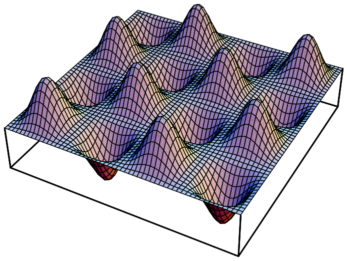

Figure 2: the upper profile of Ω_ε with f as in Figure 1

The Γ-limit theorem will be stated and proved at the end of the section after some preliminary results, which are needed to define the domain of the Γ-limit and to explain the homogenization formula.

In orded to apply the method described in the previous section we introduce the localized version of the functionals J_ε: for all U open subset of Ω we define

$$J_\varepsilon(u,U)=\begin{cases}\displaystyle\int_{\Omega_\varepsilon\cap U} W\Big(\frac{x_\alpha}{\varepsilon},Du\Big)\,dx & \text{if } u_{|\Omega_\varepsilon\cap U}\in \mathrm{W}^{1,p}(\Omega_\varepsilon\cap U;\mathbb{R}^m)\\ +\infty & \text{otherwise,}\end{cases}\tag{4.4}$$

so that $J_\varepsilon(u)=J_\varepsilon(u,\Omega)$.

The first proposition contains the analog of Steps 1–4 of the direct method of Γ-convergence as outlined in the previous section.

Proposition 4.1 *From every sequence (ε_j) of positive numbers converging to 0 we can extract a subsequence (not relabeled) such that the Γ-limit*

$$J_0(u,U)=\Gamma\text{-}\lim_{j\to+\infty} J_{\varepsilon_j}(u,U)$$

exists for all $u\in \mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$ and U open subsets of Ω. Moreover, there exists a Carathéodory function $\varphi:(-1,1)\times\mathbb{M}^{m\times n}\to[0,+\infty)$ such that

$$J_0(u,U)=\int_U \varphi(x_n,Du)\,dx$$

for all $u\in \mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$.

Proof. The functional J_ε can be rewritten on $X_\varepsilon(U)=\{u\in \mathrm{L}^p(\Omega;\mathbb{R}^m):u_{|\Omega_\varepsilon\cap U}\in \mathrm{W}^{1,p}(\Omega_\varepsilon\cap U;\mathbb{R}^m)\}$ as

$$J_\varepsilon(u,U)=\int_U \chi_{\Omega_\varepsilon}(x)W\Big(\frac{x_\alpha}{\varepsilon},Du\Big)\,dx\,.$$

We can then apply Steps 1-3 of Section 3 (see [6] Example 11.4 for the proof of the L^p-fundamental estimate). Finally, a translation argument in the x_α-plane (completely analogous, *e.g.*, to the one in the proof of [6] Proposition 14.3) shows that

$$\int_{B_\rho(x_\alpha)\times(z-\eta,z+\eta)} \varphi(y,F)\,dy = \int_{B_\rho(x'_\alpha)\times(z-\eta,z+\eta)} \varphi(y,F)\,dy$$

for all $\rho,\eta>0$, x_α, x'_α, z such that

$$\Big(B_\rho(x_\alpha)\times(z-\eta,z+\eta)\Big)\cup\Big(B_\rho(x'_\alpha)\times(z-\eta,z+\eta)\Big)\subset\Omega\,.$$

We then easily deduce that $\varphi(x,F)=\varphi(x_n,F)$. $\square$

We will complete the proof of the homogenization theorem by characterizing the function φ above (showing in particular that it does not depend on the sequence (ε_j)), proving the existence of the Γ-limit J_0 on the whole $\mathrm{L}^p(\Omega;\mathbb{R}^m)$ and showing that the integral representation in the previous proposition holds on the whole domain of J_0. In order to get to this result, we will have to define a number of auxiliary energies; here we streamline the organization of the rest of the section. First, in Section 4.1 we consider the case when $W(F)=\|F\|^p$. We will denote by ψ the function given by Proposition 4.1 corresponding to this particular choice of W. For fixed t the function $\psi(t,\cdot)$ is easily characterized by solving a $(n-1)$-dimensional (possibly, non coercive) homogenization problem. It is possible then to define the 'degenerate Sobolev Space' $\mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ of functions such that $\int_\Omega \psi(x_n,Du)\,dx<+\infty$, which turns out to be the domain of the Γ-limit when $W(F)=\|F\|^p$, and hence also in the general case by (4.1). In Section 4.2, in order to describe the function φ in the general case, with fixed t we consider the case when we replace the function f by the characteristic function of $E_t=\{x_\alpha : f(x_\alpha)>|t|\}$ (i.e., we deal with cylindrical domains). The function $\varphi(t,\cdot)$ will eventually be given by the energy density of the corresponding Γ-limit. Finally, in Section 4.3 we are able to consider general W and f and obtain the oscillating-boundary homogenization Theorem 4.15 as the consequence of the previous sections.

4.1 An auxiliary problem. Definition of the limit domain

In general, the limit functional J_0 exists and is finite also outside $\mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$. We first deal with the case of J_0 corresponding to

$$W(x,F)=\|F\|^p,\ \text{where } \|F\|^p=\sum_{j=1}^n |F_j|^p. \tag{4.5}$$

By a careful description of the domain of the corresponding Γ-limit we will identify the domain of J_0 as a suitable 'degenerate Sobolev Space' (see Definition

4.5) which, in view of the growth condition (4.1), will also be the domain of J_0 corresponding to energy densities other than (4.5).

We recall a preliminary result.

Theorem 4.2 *Let E be a 1-periodic set in $\mathbb{R}^N$; i.e., such that χ_E is a 1-periodic function, and let*

$$J_\varepsilon^E(v,U) = \begin{cases} \displaystyle\int_{U\cap\varepsilon E} \|Dv\|^p\,dx & \text{if } v_{|U\cap\varepsilon E} \in \mathrm{W}^{1,p}(U\cap\varepsilon E;\mathbb{R}^m) \\ +\infty & \text{otherwise.} \end{cases} \tag{4.6}$$

Then the Γ-limit

$$J_{\mathrm{hom}}^E(v,U) = \Gamma\text{-}\lim_{\varepsilon\to 0} J_\varepsilon^E(v,U)$$

exists for all U bounded open subsets of $\mathbb{R}^N$ and $v \in \mathrm{W}^{1,p}(U;\mathbb{R}^m)$. Moreover, we have

$$J_{\mathrm{hom}}^E(v,U) = \int_U \varphi_{\mathrm{hom}}^E(Dv)\,dx$$

for all $u \in \mathrm{W}^{1,p}(U;\mathbb{R}^m)$, where φ_{hom}^E is a positively homogeneous function of degree p, satisfying the formula

$$\varphi_{\mathrm{hom}}^E(F) = \inf\Big\{\int_{E\cap(0,1)^N} \|Dv+F\|^p\,dx : v \in \mathrm{W}_{\mathrm{loc}}^{1,p}(E;\mathbb{R}^m),\ 1\text{-periodic}\Big\}.$$

PROOF. This theorem is a particular case of [6] Theorem 14.8, the positive homogeneity of φ_{hom}^E easily following from its definition. □

For all $t \in (-1,1)$ we define

$$\varphi_\#(t,\overline{F}) = \varphi_{\mathrm{hom}}^{E_t}(\overline{F}),$$

the latter function being that given by the previous theorem, with $N = n-1$ and $E = E_t = \{x_\alpha :\ f(x_\alpha) > |t|\}$. We define also

$$\psi(t,F) = \varphi_\#(t,\overline{F}) + \mathcal{L}_{n-1}(E_t\cap(0,1)^{n-1})|F_n|^p. \tag{4.7}$$

Theorem 4.3 *If $W = \|F\|^p$ and φ is given by Proposition 4.1 then we have*

$$\varphi(t,F) = \psi(t,F).$$

In particular φ does not depend on (ε_j).

PROOF. Let (x,F) be such that x_n is a Lebesgue point for $\varphi(\cdot,F)$. Then

$$\begin{aligned} \varphi(x_n,F) &= \lim_{\rho\to 0^+} \fint_{B_\rho(x_\alpha)\times(x_n-\rho,x_n)} \varphi(y_n,F)\,dy \qquad (4.8) \\ &= \lim_{\rho\to 0^+} \frac{J_0(Fy, B_\rho(x_\alpha)\times(x_n-\rho,x_n))}{|B_\rho(x_\alpha)\times(x_n-\rho,x_n)|}. \end{aligned}$$

We consider the case $x_n > 0$ only, the case $x_n < 0$ being dealt with using a symmetric argument. Note that for $0 < t < s < 1$ we have $E_s \subseteq E_t$. Let $u_j \to 0$ with $u_j \in \mathrm{W}_0^{1,p}(B_\rho(x_\alpha) \times (x_n - \rho, x_n) \cap \Omega_{\varepsilon_j})$ be such that

$$J_0(Fy, B_\rho(x_\alpha) \times (x_n - \rho, x_n)) = \lim_{j \to +\infty} J_{\varepsilon_j}(Fy + u_j, B_\rho(x_\alpha) \times (x_n - \rho, x_n)) \, .$$

Then,

$$\begin{aligned} & J_{\varepsilon_j}(Fy + u_j, B_\rho(x_\alpha) \times (x_n - \rho, x_n)) \\ = \; & \int_{x_n - \rho}^{x_n} \int_{B_\rho(x_\alpha)} \chi_{E_{y_n}} \Big(\frac{y_\alpha}{\varepsilon_j} \Big) \| \overline{F} + D_\alpha u_j \|^p dy_\alpha \, dy_n \\ & \quad + \int_{B_\rho(x_\alpha)} \int_{x_n - \rho}^{x_n} \chi_{E_{y_n}} \Big(\frac{y_\alpha}{\varepsilon_j} \Big) |F_n + D_n u_j|^p dy_n \, dy_\alpha \\ \geq \; & \int_{x_n - \rho}^{x_n} \int_{B_\rho(x_\alpha)} \chi_{E_{x_n}} \Big(\frac{y_\alpha}{\varepsilon_j} \Big) \| \overline{F} + D_\alpha u_j \|^p dy_\alpha \, dy_n \\ & \quad + \rho \int_{B_\rho(x_\alpha)} \chi_{E_{x_n}} \Big(\frac{y_\alpha}{\varepsilon_j} \Big) |F_n|^p \, dy_\alpha \end{aligned}$$

by Jensen's inequality. By using the lower limit inequality for the Γ-convergence in Theorem 4.2 with $E = E_{x_n}$, and by an application of Fatou's Lemma, we get

$$J_0(Fy, B_\rho(x_\alpha) \times (x_n - \rho, x_n)) \geq \rho \int_{B_\rho(x_\alpha)} \varphi_\#(x_n, \overline{F}) dy_\alpha$$

$$+ \rho \mathcal{L}_{n-1}(B_\rho(x_\alpha)) |F_n|^p \mathcal{L}_{n-1}(E_{x_n} \cap (0,1)^{n-1}) \, .$$

Letting $\rho \to 0^+$ we obtain then by (4.8)

$$\varphi(x_n, F) \geq \varphi_\#(x_n, \overline{F}) + \mathcal{L}_{n-1}(E_{x_n} \cap (0,1)^{n-1}) |F_n|^p.$$

Vice versa, let $v_j \to 0$ be such that $\overline{F} y_\alpha + v_j(y_\alpha)$ is a recovery sequence for $J_{\mathrm{hom}}^{E_{x_n}}(\overline{F} y_\alpha, B_\rho(x_\alpha))$ along the sequence (ε_j), and set

$$u_j(y) = Fy + (v_j(y_\alpha), 0) = (\overline{F} y_\alpha + v_j(y_\alpha), F_n y_n) \, .$$

We then have

$$\begin{aligned} & \int_{B_\rho(x_\alpha) \times (x_n, x_n + \rho)} \varphi(y_n, A) \, dy \\ & \quad \leq \liminf_{j \to +\infty} J_{\varepsilon_j}(u_j, B_\rho(x_\alpha) \times (x_n, x_n + \rho)) \\ & \quad \leq \liminf_{j \to +\infty} \int_{B_\rho(x_\alpha) \times (x_n, x_n + \rho)} \chi_{E_{x_n}} \Big(\frac{y_\alpha}{\varepsilon_j} \Big) \| D u_j \|^p \, dy \\ & \quad = \lim_{j \to +\infty} \rho \int_{B_\rho(x_\alpha)} \chi_{E_{x_n}} \Big(\frac{y_\alpha}{\varepsilon_j} \Big) (\| \overline{F} + D_\alpha v_j \|^p + |F_n|^p) dy_\alpha \end{aligned}$$

$$= \quad \rho \int_{B_\rho(x_\alpha)} \varphi_\#(x_n, \overline{F}) dy_\alpha$$
$$+\rho \mathcal{L}_{n-1}(B_\rho(x_\alpha))|F_n|^p \mathcal{L}_{n-1}(E_{x_n} \cap (0,1)^{n-1}\,,$$

which gives the missing inequality by (4.8). □

Remark 4.4 With fixed t, we define the 'kernel' of $\varphi_\#(t, \cdot)$ as

$$\operatorname{Ker} \varphi_\# = \{\varphi_\#(t, \cdot) = 0\}.$$

Then $\operatorname{Ker} \varphi_\#$ is a linear space and its dimension is a multiple integer of m; *i.e.,*

$$\dim \operatorname{Ker} \varphi_\# = km \qquad \text{for some} \quad k = 0, \ldots, n-1$$

and there exist $\xi_{k+1}, \ldots, \xi_{n-1} \in \mathbb{R}^{n-1}$ such that

$$\overline{F} = \begin{pmatrix} F^1 \\ \vdots \\ F^m \end{pmatrix} \in \operatorname{Ker} \varphi_\# \quad \Leftrightarrow \quad \overline{F} \xi_i = 0$$

for each $i = k+1, \ldots, n-1$. (Note that k depends on t fixed and F^i denotes the i-th row of $\overline{F}$, $1 \le i \le m$).

In fact, since $\overline{F} \mapsto \varphi_\#(t, \overline{F})$ is positively homogeneous of degree p, convex and even, $\operatorname{Ker} \varphi_\#$ is a linear space and satisfies the following properties: if $\overline{F} \in Ker \varphi_\#$ then

(i) for each $(s_1, \ldots, s_m) \in \mathbb{R}^m$

$$\begin{pmatrix} s_1 F^1 \\ \vdots \\ s_m F^m \end{pmatrix} \in \operatorname{Ker} \varphi_\#;$$

(ii) $P\overline{F} \in \operatorname{Ker} \varphi_\#$ for each permutation matrix $P \in \mathbb{M}^{m \times m}$.

Properties (i) and (ii) imply that if we fix F^1 we can construct m matrices linearly independent

$$\begin{pmatrix} F^1 \\ 0 \\ \vdots \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ F^1 \\ \vdots \\ 0 \end{pmatrix}, \cdots, \begin{pmatrix} 0 \\ 0 \\ \vdots \\ F^1 \end{pmatrix} \in \operatorname{Ker} \varphi_\#$$

which span a subspace $\langle F^1 \rangle$ of $\operatorname{Ker} \varphi_\#$ of dimension m.

Now, if $\langle F^1 \rangle \neq \operatorname{Ker} \varphi_\#$, we can single out a non-zero matrix in $\operatorname{Ker} \varphi_\#$ orthogonal to $\langle F^1 \rangle$, and, by using the same argument as above taking its first row vector, find other m matrices which, together with the matrices constructed before, form a linearly independent family.

By proceeding in this way, we end up with $\eta_1, \ldots, \eta_k \in \mathbb{R}^{n-1}$ such that for all $A \in \operatorname{Ker} \varphi_\#$

$$A^i = \sum_{j=1}^{k} s_{ij} \eta_j \qquad\qquad i = 1, \ldots, m$$

with $s_{ij} \in \mathbb{R}$, which means that the $\dim \operatorname{Ker} \varphi_\# = km$ for some $k \in \{1, \ldots, n-1\}$.

The orthogonal subspace to $\langle \eta_1, \ldots, \eta_k \rangle$ is a vector subspace of $\mathbb{R}^{m(n-1)}$ $\langle \xi_{k+1}, \ldots, \xi_{n-1} \rangle$ and the vectors of the two basis satisfy, by definition, the conditions

$$\eta_i \xi_j = 0 \qquad i = 1, \ldots, k \qquad j = k+1, \ldots, n-1.$$

Hence, we can conclude that there exist vectors $\xi_{k+1}, \ldots, \xi_{n-1} \in \mathbb{R}^{n-1}$ such that $\overline{F} \in \operatorname{Ker} \varphi_\#$ if and only if $\overline{F} \xi_i = 0$ for each $i = k+1, \ldots, n-1$.

Since $t \mapsto \varphi_\#(t, \overline{F})$ is decreasing on $(0,1)$ and it is coercive on $(0, \min f)$, there exist $0 \le \min f \le t_1 \le \ldots \le t_k \le t_{k+1} \le \ldots \le t_{n-1} \le 1$ and $\xi_{k+1}, \ldots, \xi_{n-1} \in \mathbb{R}^{n-1}$ such that

(i) $\varphi_\#(t, \overline{F})$ is coercive on $(0, t_1)$;

(ii) for each $k = 1, \ldots, n-2$ $\varphi_\#(t, \overline{F}) = 0$ if and only if $\overline{F} \xi_i = 0$ for $i = k+1, \ldots, n-1$ on (t_k, t_{k+1});

(iii) $\varphi_\#(t, \overline{F}) = 0$ on $(t_{n-1}, 1)$.

Definition 4.5 *We define the 'degenerate weighted Sobolev Space'* $\mathrm{W}^{1,p}_\psi(\Omega; \mathbb{R}^m)$ *as the space of functions* $u \in \mathrm{L}^p(\Omega; \mathbb{R}^m)$ *such that*

(i) $D_n u \in \mathrm{L}^p_{\mathrm{loc}}(\Omega; \mathbb{R}^m)$*;*

(ii) $D_{(\xi_i, 0)} u \in \mathrm{L}^p_{\mathrm{loc}}(\omega \times (-t_i, t_i); \mathbb{R}^m)$ *for* $i = 1, \ldots, n-1$*;*

(iii) *if* $\Phi : \Omega \to \mathbb{M}^{m \times (n-1)}$ *is any measurable function such that* $\Phi \xi_i = D_{(\xi_i, 0)} u \in \mathrm{L}^p_{\mathrm{loc}}(\omega \times (-t_i, t_i); \mathbb{R}^m)$ *for* $i = 1, \ldots, n-1$*, then*

$$\int_\Omega \psi(x_n, \Phi | D_n u)\, dx < +\infty\,.$$

Clearly, the last integral is independent of the choice of Φ; hence, it will be denoted by

$$\int_\Omega \psi(x_n, Du)\, dx\,,$$

with a slight abuse of notation.

Remark 4.6 Note that in dimension 3 (*i.e.*, $n = 3$) the representation of the space $\mathrm{W}^{1,p}_\psi(\Omega; \mathbb{R}^m)$ is particularly simple as, up to a rotation, we can assume that

$\xi = e_2$. In this case, $\mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ is the space of functions $u \in \mathrm{L}^p(\Omega;\mathbb{R}^m)$ such that

(i) $D_3 u \in \mathrm{L}^p_{\mathrm{loc}}(\Omega;\mathbb{R}^m)$;
(ii) $D_2 u \in \mathrm{L}^p_{\mathrm{loc}}(\omega \times (-t_2,t_2);\mathbb{R}^m)$;
(iii) $D_1 u \in \mathrm{L}^p_{\mathrm{loc}}(\omega \times (-t_1,t_1);\mathbb{R}^m)$;
(iv) if $\Phi : \Omega \to \mathbb{M}^{m\times 2}$, $\Phi = (\Phi_1, \Phi_2)$ is any measurable function such that $\Phi_2 = D_2 u$ in $\omega \times (-t_2,t_2)$ and $\Phi_1 = D_1 u$ in $\omega \times (-t_1,t_1)$, then

$$\int_\Omega \psi(x_3, \Phi | D_3 u)\, dx < +\infty\,.$$

Example 4.7 If $n = 3$ and

$$f(x_1,x_2) = \frac{1}{2} + \frac{1}{2}\sin^2(x_1)\sin^2(x_2)\,,$$

then $\varphi_\#(t,\overline{F}) = \|\overline{F}\|^p$ if $|t| < 1/2$ and 0 otherwise, so that $t_1 = t_2 = 1/2$, and ξ is any vector. If instead

$$f(x_1,x_2) = \frac{1}{2} + \frac{1}{2}\sin^2(x_1)\,,$$

then $t_1 = 1/2$, $t_2 = 1$ and $\xi = (0,1)$.

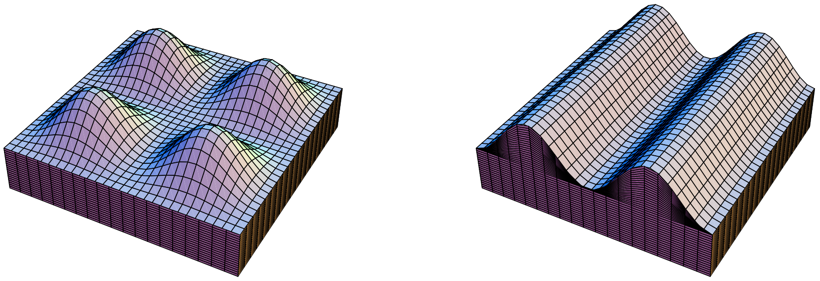

Figure 3: the oscillating profiles in Example 4.7

By using a convolution argument, we can improve Proposition 4.1 to give a characterization of the Γ-limit on the whole $\mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ and independent of the sequence (ε_j). This result corresponds to Step 6 in Section 3, and its proof uses the convexity of $F \mapsto \|F\|^p$ in an essential way.

Proposition 4.8 *Let $W = \|F\|^p$, and let U be a open subset of Ω. Then*

(i) *if $u \in \mathrm{L}^p(U;\mathbb{R}^m) \setminus \mathrm{W}^{1,p}_\psi(U;\mathbb{R}^m)$ then there exists the Γ-limit*

$$J_0(u,U) = \Gamma\text{-}\lim_{\varepsilon\to 0} J_\varepsilon(u,U) = +\infty;$$

(ii) *if* $u \in \mathrm{W}^{1,p}_{\psi}(\Omega;\mathbb{R}^m)$ *then there exists the* Γ*-limit*

$$J_0(u,U) = \Gamma\text{-}\lim_{\varepsilon\to 0} J_\varepsilon(u,U) = \int_U \psi(x_n, Du)\,dx.$$

PROOF. We only outline the proof, as it closely follows that of [6] Theorem 14.8, and details can be found therein.

Fix $u \in \mathrm{L}^p(\Omega;\mathbb{R}^m)$ and U an open subset of Ω. In order to compute $J_0(u,U)$ it is sufficient to show that from every sequence (ε_j) we can extract a subsequence (ε_{j_k}) such that the Γ-limit along (ε_{j_k}) exists and is independent of the subsequence.

We fix a sequence (ε_j). By Theorem 4.3 the thesis of Proposition 4.1 holds with ψ in the place of φ. Upon possibly extracting a further subsequence, we may also assume that there exists the limit

$$J_0(u,U) = \Gamma\text{-}\lim_{j\to+\infty} J_{\varepsilon_j}(u,U).$$

Let (ρ_j) be a sequence of mollifiers with $\mathrm{spt}\rho_j \subset B(0,\frac{1}{j}) \subset \mathbb{R}^{n-1}$, and define

$$u_j(x) = \int_{B(0,\frac{1}{j})} \rho_j(y) u(x_\alpha - y, x_n)\,dy.$$

By the convexity of J_0 and its translation-invariance properties, we have $J_0(u_j,U') \le J_0(u,U)$ for all $U' \subset\subset U$ such that $U' \subset (y,0)+U$ for all $y \in \mathrm{spt}\rho_j$. By the convexity of ψ the functional $v \mapsto \int_{U'} \psi(x_n,Dv)\,dx$ (if $v \in \mathrm{L}^p(U';\mathbb{R}^m) \setminus \mathrm{W}^{1,p}_{\psi}(U';\mathbb{R}^m)$ this integral is set equal to $+\infty$) is lower semicontinuous with respect to the $\mathrm{L}^p(U';\mathbb{R}^m)$ convergence. Hence, we have

$$\int_{U'} \psi(x_n, Du)\,dx \le \liminf_{j\to+\infty} \int_{U'} \psi(x_n, Du_j)\,dx \le J_0(u,U).$$

By the arbitrariness of U' we get

$$\int_U \psi(x_n, Du)\,dx \le J_0(u,U), \tag{4.9}$$

and in particular that $J_0(u,U) = +\infty$ if $u \in \mathrm{L}^p(U;\mathbb{R}^m) \setminus \mathrm{W}^{1,p}_{\psi}(U;\mathbb{R}^m)$, so that (i) is proved.

Let now $u \in \mathrm{W}^{1,p}_{\psi}(\Omega;\mathbb{R}^m)$. We first assume that $U \subset\subset U' \subset\subset \Omega$. By using the lower semicontinuity of J_0 and Jensen's inequality, we have

$$\begin{aligned}
J_0(u,U) &\le \liminf_{j\to+\infty} J_0(u_j,U) = \liminf_{j\to+\infty} \int_U \psi(x_n, Du_j)\,dx \\
&\le \liminf_{j\to+\infty} \int_U \int_{B(0,\frac{1}{j})} \rho_j(y)\psi(x_n, Du(x-(y,0)))\,dx\,dy \\
&= \liminf_{j\to+\infty} \int_{B(0,\frac{1}{j})} \rho_j(y) \int_{U+(y,0)} \psi(x_n, Du)\,dx\,dy \\
&\le \liminf_{j\to+\infty} \int_{B(0,\frac{1}{j})} \rho_j(y)\,dy \int_{U'} \psi(x_n, Du)\,dx = \int_{U'} \psi(x_n, Du)\,dx.
\end{aligned}$$

By the arbitrariness of U' we then get

$$J_0(u,U) \le \int_U \psi(x_n, Du)\,dx, \tag{4.10}$$

so that (ii) follows by taking (4.9) into account.

Finally, for arbitrary U, note that if $u \in \mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ then it can be approximated by a sequence (v_j) of functions in $\mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$ such that $\int_\Omega \psi(x_n, Dv_j)\,dx$ are equi-bounded (we may use *e.g.* the argument in the proof of [15] Section 4.2 Theorem 3); hence, by the lower semicontinuity of $J'' = \Gamma\text{-}\limsup_j J_{\varepsilon_j}$, we have $J''(u) < +\infty$. This fact implies (as in *e.g.* [6] Section 11.2) that J'' is inner-regular; i.e.,

$$J''(u,U) = \sup\Big\{ J''(u,V) : V \subset\subset U \Big\}\,.$$

Since (ii) holds with V in the place of U we easily get the thesis. ☐

The following proposition clarifies the structure of $\mathrm{W}^{1,p}_\psi$, and implies that the restrictions of functions $u \in \mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ to relatively compact subsets of $\omega \times (t_k, t_{k+1})$ are characterized as those functions having directional derivatives $D_{k+1}, \dots, D_n$ p-summable.

Proposition 4.9 *Let $k = 1, \dots, n-2$ and $s \in (t_k, t_{k+1})$. There exist two positive constants $\alpha_k(s)$ and β_k such that*

$$\alpha_k(s) \Big(\sum_{i=k+1}^{n-1} |\overline{F}\xi_i|^p + |F_n|^p \Big) \le \psi(t,F) \le \beta_k \Big(\sum_{i=k+1}^{n-1} |\overline{F}\xi_i|^p + |F_n|^p \Big) \tag{4.11}$$

for all $F \in \mathbb{M}^{m\times n}$ and $t \in (t_k, s]$.

Proof. Since $\overline{F} \mapsto \varphi_\#(t,\overline{F})$ is positively homogeneous of degree p and convex, if $t \in (t_k, t_{k+1})$ we easily deduce that

$$\varphi_\#(t,\overline{F}) \le c \sum_{i=k+1}^{n-1} \varphi_\#(t,\Xi_i) |\overline{F}\xi_i|^p$$

where

$$\Xi_i = \begin{pmatrix} \xi_i \\ 0 \\ \vdots \\ 0 \end{pmatrix}.$$

If we denote

$$\beta'_k = \max_{i=k+1,\dots,n-1} \sup_{t\in[0,1)} c\,\varphi_\#(t,\Xi_i)$$

then

$$\varphi_{\#}(t,\overline{F}) \le \beta'_k \sum_{i=k+1}^{n-1} |\overline{F}\xi_i|^p. \tag{4.12}$$

On the other hand we have that

$$\begin{aligned}\frac{\varphi_{\#}(t,\overline{F})}{\sum_{i=k+1}^{n-1}|\overline{F}\xi_i|^p} &\ge c\,\frac{\varphi_{\#}(t,(\overline{F}\xi_{k+1},\dots,\overline{F}\xi_{n-1}))}{\|(\overline{F}\xi_{k+1},\dots,\overline{F}\xi_{n-1})\|^p}\\ &\ge c\inf\{\varphi_{\#}(t,G)\,:\,G\in S^{n-1}\cap \mathrm{Ker}{\varphi_{\#}}^{\perp}\}\end{aligned}$$

by p-homogeneity. Note that $t\mapsto c\,\inf\{\varphi_{\#}(t,G)\,:\,G\in S^{n-1}\cap \mathrm{Ker}{\varphi_{\#}}^{\perp}\} = c(t)$ is decreasing on $(0,1)$ and

$$\inf_{t\in(t_k,s]} c(t) = \alpha'_k(s) > 0,$$

so that we get

$$\varphi_{\#}(t,\overline{F}) \ge \alpha'_k(s) \sum_{i=k+1}^{n-1} |\overline{F}\xi_i|^p. \tag{4.13}$$

Let

$$\alpha_k(s) = \min\{\alpha'_k(s), \inf_{t\in(t_k,s]} \mathcal{L}_{n-1}(E_t\cap(0,1)^{n-1})\}$$

and

$$\beta_k = \max\{\beta'_k, 1\},$$

then (4.11) follows by Theorem 4.3, (4.12) and (4.13). $\square$

Proposition 4.10 *Fix $t\in(t_k,t_{k+1})$, for $k=0,\dots,n-1$ ($t_0=0, t_n=1$). If ψ is given by (4.7) then*

$$\begin{aligned}\psi(t,F) &= \min\Big\{\int_{(0,1)^n\cap(E_t\times(0,1))} \|Dw\|^p\,dx :\\ &\qquad w\in \mathrm{W}^{1,p}_{\mathrm{loc}}(E_t\times(0,1);\mathbb{R}^m),\ w-Fx\ 1\text{-periodic}\Big\}.\end{aligned}$$

Proof. Let w be a test function for the minimum problem above, then

$$\begin{aligned}&\int_{(0,1)^n\cap(E_t\times(0,1))} \|Dw\|^p\,dx\\ =\ &\int_{(0,1)^n\cap(E_t\times(0,1))} \|D_\alpha w\|^p\,dx + \int_{(0,1)^n\cap(E_t\times(0,1))} |D_n w|^p\,dx\\ \ge\ &\int_0^1 \min\Big\{\int_{E_t\cap(0,1)^{n-1}} \|Dv\|^p\,dx_\alpha :\end{aligned}$$

$$\begin{aligned} & \qquad\qquad v \in \mathrm{W}^{1,p}_{\mathrm{loc}}(E_t;\mathbb{R}^m),\ v - \overline{F}x_\alpha \text{ 1-periodic}\Big\} \, dx_n \\ & + \int_{E_t\cap(0,1)^{n-1}} \Big(\int_0^1 |D_n w|^p \, dx_n\Big) \, dx_\alpha \\ \geq\ & \varphi_\#(t,\overline{F}) + \mathcal{L}_{n-1}(E_t\cap(0,1)^{n-1})|F_n|^p = \psi(t,F) \end{aligned}$$

by Jensen's inequality and the description of $\varphi_\#$ (see Theorem 4.2); hence,

$$\begin{aligned} \psi(t,F) \ \leq\ & \min\Big\{\int_{(0,1)^n\cap E_t\times(0,1)} \|Dw\|^p \, dx : \\ & \qquad w \in \mathrm{W}^{1,p}_{\mathrm{loc}}(E_t\times(0,1);\mathbb{R}^m),\ w - Fx \text{ 1-periodic}\Big\} \end{aligned}$$

by Theorem 4.3.

Conversely, given a function v such that $v - \overline{F}x_\alpha$ is 1-periodic, we can construct a test function w, such that $w - Fx$ 1-periodic, as

$$w(x) = v(x_\alpha) - F_n x_n \,.$$

We then have

$$\begin{aligned} & \int_{(0,1)^n\cap(E_t\times(0,1))} \|Dw\|^p \, dx \\ =\ & \int_{(0,1)^n\cap(E_t\times(0,1))} (\|D_\alpha v\|^p + |F_n|^p) \, dx \\ =\ & \int_{E_t\cap(0,1)^{n-1}} \|D_\alpha v\|^p \, dx_\alpha + \mathcal{L}_{n-1}(E_t\cap(0,1)^{n-1})|F_n|^p \\ \geq\ & \min\Big\{\int_{(0,1)^n\cap(E_t\times(0,1))} \|Dw\|^p \, dx : \\ & \qquad w \in \mathrm{W}^{1,p}_{\mathrm{loc}}(E_t\times(0,1);\mathbb{R}^m),\ w - Fx \text{ 1-periodic}\Big\} \end{aligned}$$

and hence the converse inequality

$$\begin{aligned} \psi(t,F) \ =\ & \min\Big\{\int_{E_t\cap(0,1)^{n-1}} \|Dv\|^p \, dx_\alpha : \\ & \qquad v \in \mathrm{W}^{1,p}_{\mathrm{loc}}(E_t;\mathbb{R}^m),\ v - \overline{F}x_\alpha \text{ 1-periodic}\Big\} \\ & + \mathcal{L}_{n-1}(E_t\cap(0,1)^{n-1})|F_n|^p \\ \geq\ & \min\Big\{\int_{(0,1)^n\cap(E_t\times(0,1))} \|Dw\|^p \, dx : \\ & \qquad w \in \mathrm{W}^{1,p}_{\mathrm{loc}}(E_t\times(0,1);\mathbb{R}^m),\ w - Fx \text{ 1-periodic}\Big\} \end{aligned}$$

is obtained as desired. □

Now we can turn our attention to the case with a general W. Now that a natural domain for the limit functional is defined, we can easily state and prove a compactness result that partly improves Proposition 4.1.

Theorem 4.11 *Let J_ε be given by* (4.4)*. Then for every sequence (ε_j) of positive numbers converging to* 0 *there exists a subsequence (not relabeled) such that the Γ-limit*

$$J_0(u,U) = \Gamma\text{-}\lim_{j\to+\infty} J_{\varepsilon_j}(u,U)$$

exists for all $u \in \mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ and U open subsets of Ω. Moreover $J_0(u,\cdot)$ is the restriction of a Borel measure to $\mathcal{A}(\Omega)$.

Proof. By (4.1) and Proposition 4.8 we deduce the condition

$$\Gamma\text{-}\limsup_{\varepsilon\to 0} J_\varepsilon(u,U) \le \beta \int_U (1+\psi(x_n,Du))\,dx \tag{4.14}$$

if $u \in \mathrm{W}^{1,p}_\psi(U;\mathbb{R}^m)$ and U is an open subset of Ω. Then, we can follow the Steps 1–3 in Section 3 to prove the compactness of (J_ε) and that $J_0(u,\cdot)$ is the restriction of a Borel measure to $\mathcal{A}(\Omega)$. □

4.2 Homogenization of cylindrical domains

It remains now to extend the integral representation of Proposition 4.1 and characterize its integrand. We first deal with the case of 'cylindrical' domains; *i.e.,* we consider χ_E in place of f, with E a 1-periodic open subset of $\mathbb{R}^{n-1}$.

Let $t_1,\dots,t_{n-1}$ be the points in $(0,1)$ introduced to characterize the 'degenerate weighted Sobolev Space' in Definition 4.5. Since in the following we will choose $E = E_t$ (E_t defined as $\{x_\alpha : f(x_\alpha) > |t|\}$) we introduce the following notation: with fixed $t \in (0,1)$, $t \ne t_k$ for $k = 1,\dots,n-1$, consider the set E_t and the functional

$$J^t_\varepsilon(u,U) = \begin{cases} \displaystyle\int_{\Omega_\varepsilon\cap U_\varepsilon} W\Big(\frac{x_\alpha}{\varepsilon},Du\Big)\,dx & \text{if } u \in \mathrm{W}^{1,p}(\Omega_\varepsilon\cap U_\varepsilon;\mathbb{R}^m) \\ +\infty & \text{otherwise,} \end{cases} \tag{4.15}$$

where $U_\varepsilon = U\cap(\varepsilon E_t\times(-1,1))$. Note that the integrand of J^t_ε satisfies the following growth conditions

$$\gamma g(x,A) \le \chi_{E_t\times(-1,1)} W(x_\alpha,A) \le \beta(1+g(x,A)) \tag{4.16}$$

where $g(x,A) = \chi_{E_t\times(-1,1)}(x)\|A\|^p$ is obviously 1-periodic in x, convex in A and satisfying

$$0 \le g(x,A) \le 1+\|A\|^p \text{ and } g(x,2A) \le c(1+g(x,A))$$

for all $A \in \mathbb{M}^{m\times n}$.

Remark 4.12 Note that if we fix $t \in (t_{k-1}, t_k)$ and consider χ_{E_t} in place of f then $\mathrm{W}^{1,p}_{\psi}(\Omega;\mathbb{R}^m)$ turns out to be the space

$$\begin{aligned}\mathrm{W}^{1,p}_{k}(\Omega;\mathbb{R}^m) \quad &= \quad \{u \in \mathrm{L}^p(\Omega;\mathbb{R}^m) : D_n u \in \mathrm{L}^p(\Omega;\mathbb{R}^m), D_{\xi_i} u \in \mathrm{L}^p(\Omega;\mathbb{R}^m) \\ &\qquad\qquad\qquad\qquad i = k, \dots, n-1\}\end{aligned}$$

if $k = 1, \dots, n-1$, and

$$\mathrm{W}^{1,p}_{n}(\Omega;\mathbb{R}^m) = \{u \in \mathrm{L}^p(\Omega;\mathbb{R}^m) \, : \, D_n u \in \mathrm{L}^p(\Omega;\mathbb{R}^m)\}.$$

if $k = n$.

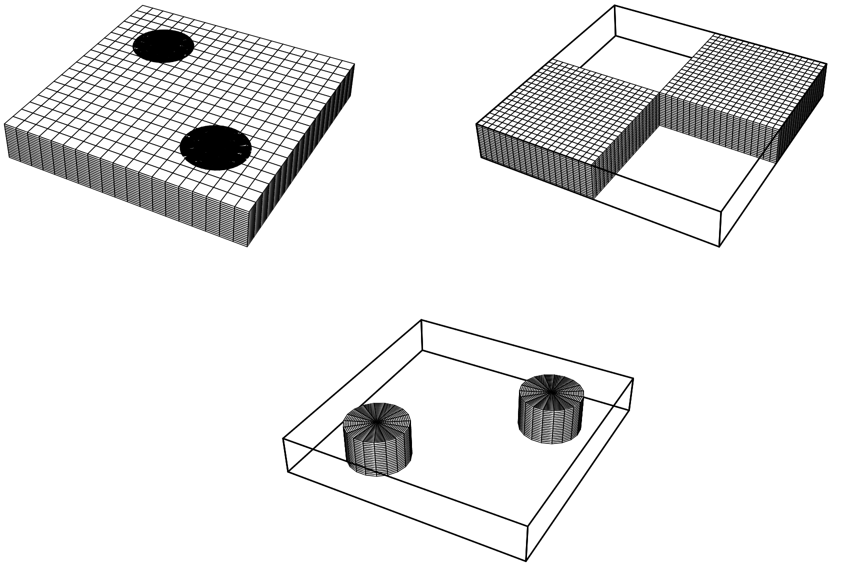

Figure 4: cylindrical domains $E_t \times (-1, 1)$ related to the function f in Figure 1 for different values of t

Theorem 4.13 *Let $t \in (t_{k-1}, t_k)$ and let $J^t_\varepsilon(\cdot, U)$ be defined by (4.15). Then the Γ-limit*

$$J^t_0(u, U) = \int_U W^t_{\mathrm{hom}}(Du)\, dx$$

exists for each $u \in \mathrm{W}^{1,p}_k(\Omega;\mathbb{R}^m)$ and U open subset of Ω, where W^t_{hom} is given by

$$\begin{aligned}W^t_{\mathrm{hom}}(A) \quad &= \quad \lim_{T \to +\infty} \inf\Big\{ \frac{1}{T^n} \int_{(0,T)^n} \chi_{E_t}(x_\alpha) W(x_\alpha, A + Du(x))\, dx : \\ &\qquad\qquad u \in \mathrm{W}^{1,p}_0((0,T)^n;\mathbb{R}^m) \Big\}\end{aligned}$$

for all $A \in \mathbb{M}^{m\times n}$.

Proof. By taking Theorem 4.11 into account with χ_{E_t} in the place of f, and repeating word for word the proof of the integral representation theorem [6] Theorem 9.1, replacing $\mathrm{W}^{1,p}(\Omega;\mathbb{R}^m)$ by $\mathrm{W}^{1,p}_k(\Omega;\mathbb{R}^m)$, we obtain an integral representation on the whole $\mathrm{W}^{1,p}_k(\Omega;\mathbb{R}^m)$. The integrand of this representation must coincide with the function $\varphi = \varphi(x_n, F)$ provided by Proposition 4.1 with χ_{E_t} in the place of f. Since the functionals are clearly invariant by translations in the direction x_n we have indeed $\varphi = \varphi(F)$. To prove the asymptotic formula we can repeat the proof of Proposition 21.12 in [6]. □

4.3 The general case

We can eventually proceed to dealing with the general case.

Proposition 4.14 *Let* J_ε *be given by* (4.4). *Then the* Γ*-limit*

$$J_0(u,U) = \Gamma\text{-}\lim_{\varepsilon\to 0} J_\varepsilon(u,U)$$

exists for all $u \in \mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ *and* U *open subsets of* Ω. *Moreover, for such* u *we have*

$$J_0(u,U) = \int_U \varphi(x_n, Du)\,dx,$$

where φ *is given by Proposition* 4.1.

Proof. We have to extend the representation of J_0 given by Proposition 4.1 to $\mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$. Note that φ is a Carathéodory function (see [6] Theorem 9.1, Step 3). As explained in Step 3 of Section 3, a crucial argument used to obtain an integral representation result is the continuity in $\mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ of the functional

$$u \mapsto \int_U \varphi(x_n, Du)\,dx$$

along some strongly converging sequences of piecewise-affine functions. We only prove this property, as the rest of the proof follows exactly that of [6] Theorem 9.1 (Steps 1–3, 5 and 6; the proof below replaces Step 4).

Let $U = \bigcup_{k=0}^{n-1} U_k$ where $U_k \subset\subset \omega \times (t_k, t_{k+1})$, $(t_0 = 0, t_n = 1)$; we can find functions $u_j \in \mathrm{W}^{1,p}_\psi(\Omega;\mathbb{R}^m)$ such that their restrictions to U are piecewise affine and $u_j, D_n u_j$ converge strongly to $u, D_n u$ in $\mathrm{L}^p(U;\mathbb{R}^m)$, respectively, while $D_{(\xi_i,0)}u_j$ converge strongly to $D_{(\xi_i,0)}u$ in $\mathrm{L}^p(U_i;\mathbb{R}^m)$.

We will use some estimates deriving from the inequality $\varphi(t,F) \le \beta(1 + \psi(t,F))$, which follows trivially from (4.1). By Proposition 4.9 we have that

$$\psi(x_n, Du) \quad \le \quad \beta_k\Big(\sum_{i=k+1}^{n-1} |D_{(\xi_i,0)}u|^p + |D_n u|^p\Big)$$

$$\psi(x_n, Du_j) \quad \leq \quad \beta_k \Big(\sum_{i=k+1}^{n-1} |D_{(\xi_i,0)} u_j|^p + |D_n u_j|^p \Big)$$

on $\omega \times (t_k, t_{k+1})$. Note that by (4.14)

$$\begin{aligned} \int_U \varphi(x_n, Du_j)\, dx \quad & \leq \quad \sum_{k=0}^{n-2} \int_{U_k \cap \omega \times (t_k, t_{k+1})} \beta \Big(1 + \sum_{i=k+1}^{N} \beta_k |D_{(\xi_i,0)} u_j|^p \Big)\, dx \\ & \quad + \beta \int_U \beta_k |D_n u_j|^p \, dx. \end{aligned}$$

If we use the continuity of φ in the second variable and apply Fatou's lemma to the sequences

$$\begin{aligned} \beta \int_U \beta_k |D_n u_j|^p \, dx \quad & + \quad \sum_{k=0}^{n-2} \int_{U_k \cap \omega \times (t_k, t_{k+1})} \beta \Big(1 + \sum_{i=k+1}^{n-1} \beta_k |D_{(\xi_i,0)} u_j|^p \Big)\, dx \\ & \pm \quad \int_U \varphi(x_n, Du_j)\, dx \end{aligned}$$

we get that

$$\int_U \varphi(x_n, Du)\, dx = \lim_{j \to +\infty} \int_U \varphi(x, Du_j)\, dx.$$

Hence, we have proved the integral representation for sets of the type $U = \bigcup_{k=0}^{n-1} U_k$ where $U_k \subset\subset \omega \times (t_k, t_{k+1})$. A symmetric argument applies to the case where $U = \bigcup_{k=0}^{n-1} U_k$, with $U_k \subset\subset \omega \times (-t_{k+1}, -t_k)$. Since $J_0(u, \cdot)$ is a measure absolutely continuous with respect to Lebesgue measure, we conclude that the integral representation holds for all open subsets U of Ω. $\square$

Finally, the oscillating-boundary homogenization theorem reads as follows.

Theorem 4.15 *Let J_ε be given by* (4.2). *Then the Γ-limit*

$$J_0(u) = \Gamma\text{-}\lim_{\varepsilon \to 0} J_\varepsilon(u)$$

exists for all $u \in \mathrm{L}^p(\Omega; \mathbb{R}^m)$, and we have

$$J_0(u) = \begin{cases} \displaystyle\int_\Omega W_{\mathrm{hom}}(|x_n|, Du)\, dx & \text{if } u \in \mathrm{W}^{1,p}_\psi(\Omega; \mathbb{R}^m) \\ +\infty & \text{otherwise,} \end{cases}$$

where $W_{\mathrm{hom}}(t, A) = W^t_{\mathrm{hom}}(A)$ for a.e. $t \in (0,1)$, and W^t_{hom} is given by Theorem 4.13. Moreover, if $u \in \mathrm{W}^{1,p}(\Omega; \mathbb{R}^m)$ there exists a family (u_ε) converging to u in $\mathrm{L}^p(\Omega; \mathbb{R}^m)$, such that $u - u_\varepsilon$ has compact support in Ω and $J_0(u) = \lim_{\varepsilon \to 0} J_\varepsilon(u_\varepsilon)$.

Proof. It is sufficient to compute the Γ-limit for $u \in \mathrm{W}^{1,p}_{\psi}(\Omega;\mathbb{R}^m)$, since by comparison with Proposition 4.8(i) we immediately have $J_0(u) = +\infty$ if $u \notin \mathrm{W}^{1,p}_{\psi}(\Omega;\mathbb{R}^m)$. Let φ be given by Proposition 4.1; it remains to prove that φ satisfies an asymptotic formula.

Let $x_n > 0$, let $0 < \rho < x_n$ and consider the functionals (4.15) with $t = x_n - \rho$ and $t = x_n$ so that

$$\begin{aligned} & J^{x_n-\rho}_{\varepsilon}(Ax,(0,1)^{n-1}\times(x_n-\rho,x_n)) \\ & \quad \geq \int_{(0,1)^{n-1}\times(x_n-\rho,x_n)} \chi_{E_{y_n}}\Big(\frac{y_\alpha}{\varepsilon}\Big) W\Big(\frac{x_\alpha}{\varepsilon},A\Big)\,dy \\ & \quad \geq J^{x_n}_{\varepsilon}(Ax,(0,1)^{n-1}\times(x_n-\rho,x_n))\,. \end{aligned}$$

By Theorem 4.13

$$\begin{aligned} \rho\, W^{x_n-\rho}_{\mathrm{hom}}(A) & \geq \Gamma\text{-}\lim_{\varepsilon\to 0} J_{\varepsilon}(Ax,(0,1)^{n-1}\times(x_n-\rho,x_n)) \\ & \geq \rho\, W^{x_n}_{\mathrm{hom}}(A). \end{aligned}$$

Taking into account that

$$\Gamma\text{-}\lim_{\varepsilon\to 0} J_{\varepsilon}(Ax,(0,1)^{n-1}\times(x_n-\rho,x_n)) = \int_{(0,1)^{n-1}\times(x_n-\rho,x_n)} \varphi(y_n,A)\,dy$$

we get

$$W^{x_n-\rho}_{\mathrm{hom}}(A) \leq \frac{1}{\rho}\int_{(x_n-\rho,x_n)} \varphi(y_n,A)\,dy_n \leq W^{x_n}_{\mathrm{hom}}(A).$$

Since $t \mapsto W^t_{\mathrm{hom}}(A)$ and $t \mapsto \varphi(t,A)$ are decreasing functions on $(0,1)$, there exists a subset M of $(0,1)$, $|M| = 0$, such that they are continuous on $(0,1)\setminus M$; hence, by passing to the limit as $\rho \to 0$ we get

$$\varphi(x_n,A) = W^{x_n}_{\mathrm{hom}}(A)$$

for every $x_n \in (0,1)\setminus M$. For $x_n < 0$ it suffices to apply a symmetric argument.

The last statement follows by a well-known argument of stability of Γ-convergence by compatible boundary data due to De Giorgi (see [6] Section 11.3). □

5 Thin films with fast-oscillating profile

In this section we establish the second goal of the paper; that is, to prove that the Γ-limit of functionals $E_{\varepsilon,\delta}$ as in (1.1) when $\varepsilon \to 0$ and $\delta << \varepsilon$, is given by first applying the theory constructed in the previous section with ε as a parameter and letting $\delta \to 0$, and subsequently letting $\varepsilon \to 0$. The final result can be summarized as follows, in a n-dimensional setting.

Theorem 5.1 *Let $f : \mathbb{R}^{n-1} \to [0,1]$ be a 1-periodic lower semicontinuous function with $0 < \min f \le \sup f = 1$, let $W : \mathbb{M}^{m\times n} \to [0,+\infty)$ be a convex function satisfying*

$$\gamma|F|^p \le W(F) \le \beta(1+|F|^p)$$

for all $F \in \mathbb{M}^{m\times n}$ and for some $1 < p < +\infty$, $0 < \gamma \le \beta$. Let $\delta : (0,+\infty) \to (0,+\infty)$ be such that

$$\lim_{\varepsilon\to 0} \frac{\delta(\varepsilon)}{\varepsilon} = 0.$$

Let ω be a bounded open subset of $\mathbb{R}^{n-1}$ and let $\Omega_\varepsilon \subset \omega \times (-1,1)$ be defined by

$$\Omega_\varepsilon = \Big\{x \in \mathbb{R}^n : \ |x_n| < f\Big(\frac{x_\alpha}{\delta(\varepsilon)}\Big), x_\alpha \in \omega\Big\}. \tag{5.1}$$

Define $E_\varepsilon : \mathrm{L}^p(\omega \times (-1,1)) \to [0,+\infty]$ by

$$E_\varepsilon(u) = \begin{cases} \displaystyle\int_{\Omega_\varepsilon} W\Big(D_\alpha u, \frac{1}{\varepsilon} D_n u\Big)\,dx & \text{if } u\big|_{\Omega_\varepsilon} \in \mathrm{W}^{1,p}(\Omega_\varepsilon;\mathbb{R}^m) \\ +\infty & \text{otherwise.} \end{cases} \tag{5.2}$$

Then the Γ-limit as $\varepsilon \to 0$ of E_ε is given by

$$E(u) = \begin{cases} \displaystyle\int_{\omega\times(-1,1)} \overline{W}_{\mathrm{hom}}(D_\alpha u)\,dx & \text{if } u \in \mathrm{W}^{1,p}(\omega\times(-1,1);\mathbb{R}^m) \text{ and } D_n u = 0 \\ +\infty & \text{otherwise,} \end{cases} \tag{5.3}$$

where $\overline{W}_{\mathrm{hom}} : \mathbb{M}^{m\times(n-1)} \to [0,+\infty)$ is given by

$$\overline{W}_{\mathrm{hom}}(\overline{F}) = \int_0^1 \inf_{F_n} W_{\mathrm{hom}}(t, \overline{F}|F_n)\,dt, \tag{5.4}$$

and W_{hom} by

$$\begin{aligned} W_{\mathrm{hom}}(t,F) \quad = \quad \inf\Big\{ \int_{(0,1)^n} \chi_{E_t}(x_\alpha)\, W(F + Du(x))\,dx : \\ u \in \mathrm{W}^{1,p}_{\mathrm{loc}}(\mathbb{R}^n;\mathbb{R}^m) \ \text{1-periodic}\Big\} \end{aligned} \tag{5.5}$$

for all $t \in (0,1)$ and $F \in \mathbb{M}^{m\times n}$, where $E_t = \{f > t\}$.

5.1 Proof of the result

In order to simplify the proof without loosing sight of the main intricacies of the argument, we deal only with the case where $\varepsilon = 1/j$ and $\delta = \varepsilon^2$. The general case can be dealt with similarly, by introducing some error terms. We define, with a slight abuse of notation,

$$\Omega_k = \{x \in \Omega : \ |x_n| < f(kx_\alpha)\}$$

and for $k = j^2$, $j \in \mathbb{N}$

$$E_j(u, U) = \int_{\Omega_{j^2} \cap U} W(D_\alpha u | j D_n u)\, dx$$

for all $u_{|\Omega_{j^2} \cap U} \in \mathrm{W}^{1,p}(\Omega_{j^2} \cap U; \mathbb{R}^m)$.

By the compactness result Theorem 2.5 in [8] we can suppose that there exists $W_0 : \mathbb{M}^{m \times (n-1)} \to [0, +\infty)$ such that $E_j(u, U)$ Γ-converge for all sets of the form $U = U' \times (-1, 1)$ or $U = U' \times (0, 1)$ to the functional given by

$$E_0(u, U) = \begin{cases} \displaystyle\int_U W_0(D_\alpha u)\, dx & \text{if } u \in \mathrm{W}^{1,p}(U; \mathbb{R}^m) \text{ and } D_n u = 0 \\ +\infty & \text{otherwise.} \end{cases} \tag{5.6}$$

Proposition 5.2 *For all* $\overline{F} \in \mathbb{M}^{m \times (n-1)}$ *define*

$$\begin{aligned} \overline{W}_{\mathrm{hom}}(\overline{F}) \quad = \quad \inf \Big\{ \int_{(0,1)^n} W_{\mathrm{hom}}(x_n, Du + \overline{F})\, dx : \\ u \in \mathrm{W}^{1,p}_{\mathrm{loc}}(\mathbb{R}^n; \mathbb{R}^m),\ u \ 1\text{-periodic in } x_\alpha \Big\}. \end{aligned} \tag{5.7}$$

Then

$$\overline{W}_{\mathrm{hom}}(\overline{F}) = \int_0^1 \widetilde{W}_{\mathrm{hom}}(t, \overline{F})\, dt, \tag{5.8}$$

where

$$\widetilde{W}_{\mathrm{hom}}(t, \overline{F}) = \inf_{F_n} W_{\mathrm{hom}}(t, \overline{F} | F_n) \tag{5.9}$$

and $\overline{F} \mapsto \widetilde{W}_{\mathrm{hom}}(t, \overline{F})$ *is convex.*

Proof. It can be easily proved that $\overline{F} \mapsto \widetilde{W}_{\mathrm{hom}}(t, \overline{F})$ is convex.

With fixed $\eta > 0$, by the Measurable Selection Criterion (see e.g [12]), we can find $G_n(t)$ a measurable function such that

$$W_{\mathrm{hom}}(t, \overline{F} | G_n) \leq \inf_{F_n} W_{\mathrm{hom}}(t, \overline{F} | F_n) + \eta.$$

We can consider

$$u(x_\alpha, x_n) = \int_0^{x_n} G_n(s)\, ds$$

as test function in (5.7). We then get

$$\overline{W}_{\mathrm{hom}}(\overline{F}) \leq \int_0^1 W_{\mathrm{hom}}(x_n, \overline{F} | G_n(x_n))\, dx_n$$

and so

$$\overline{W}_{\rm hom}(\overline{F}) \le \int_0^1 \inf_{F_n} W_{\rm hom}(t,\overline{F}|F_n)\,dt + \eta = \int_0^1 \widetilde{W}_{\rm hom}(t,\overline{F})\,dt + \eta.$$

Conversely,

$$\begin{aligned}
\overline{W}_{\rm hom}(\overline{F}) \quad &\ge \quad \inf\Big\{\int_{(0,1)^n} \widetilde{W}_{\rm hom}(x_n, D_\alpha u + \overline{F})\,dx : \\
&\qquad u \in {\rm W}^{1,p}_{\rm loc}((0,1)^n;\mathbb{R}^m),\ u \text{ 1-periodic } \text{ in}\, x_\alpha\Big\} \\
&\ge \quad \int_0^1 \Big(\inf\Big\{\int_{(0,1)^{n-1}} \widetilde{W}_{\rm hom}(t, D_\alpha u + \overline{F})\,dx_\alpha : \\
&\qquad u_{|(0,1)^{n-1}} \in {\rm W}^{1,p}_{\rm loc}((0,1)^{n-1};\mathbb{R}^m),\ u \text{ 1-periodic } \text{ in}\, x_\alpha\Big\}\Big)\,dt \\
&\ge \quad \int_0^1 \widetilde{W}_{\rm hom}(t,\overline{F})\,dt
\end{aligned}$$

by Jensen's inequality. ☐

Theorem 5.3 *For all* $\overline{F} \in \mathbb{M}^{m\times(n-1)}$ *we have* $W_0(\overline{F}) = \overline{W}_{\rm hom}(\overline{F})$.

Proof. With fixed $\eta > 0$ let v be a test function for (5.7) such that

$$\int_{(0,1)^n} W_{\rm hom}(x_n, Dv + \overline{F})\,dx \le \overline{W}_{\rm hom}(\overline{F}) + \eta\,.$$

By Theorem 4.15 there exists a sequence v_j converging to v such that $v_j = v$ on $\partial(0,1)^n$ (and, hence, in particular v_j is 1-periodic in x_α) and

$$\int_{(0,1)^n} W_{\rm hom}(x_n, Dv + \overline{F})\,dx = \lim_{j\to+\infty} \int_{\Omega_j\cap(0,1)^n} W(Dv_j + \overline{F})\,dx\,. \tag{5.10}$$

If we define $u_j(x_\alpha, x_n) = \frac{1}{j} v_j(jx_\alpha, x_n)$ then $u_j \to 0$ in ${\rm L}^p((0,1)^n;\mathbb{R}^m)$ and

$$\begin{aligned}
\int_{\Omega_j\cap(0,1)^n} W(Dv_j + \overline{F})\,dx \quad &= \quad \frac{1}{j^{n-1}} \int_{\Omega_j\cap((0,j)^{n-1}\times(0,1))} W(Dv_j + \overline{F})\,dx \\
&= \quad \int_{\Omega_{j^2}\cap(0,1)^n} W(Dv_j(jy_\alpha, y_n) + \overline{F})\,dy \\
&= \quad \int_{\Omega_{j^2}\cap(0,1)^n} W(D_\alpha u_j + \overline{F}|jD_n u_j)\,dy \\
&= \quad E_j(u_j + \overline{F}x_\alpha, (0,1)^n);
\end{aligned} \tag{5.11}$$

hence, we can conclude that

$$\begin{aligned} W_0(\overline{F}) &\leq \liminf_{j\to+\infty} E_j(u_j + \overline{F}x_\alpha, (0,1)^n) \\ &= \liminf_{j\to+\infty} \int_{\Omega_j \cap (0,1)^n} W(Dv_j + \overline{F})\, dx \\ &\leq \overline{W}_{\mathrm{hom}}(\overline{F}) + \eta \end{aligned}$$

by (5.6), (5.11), (5.10) and (5.7).

Now we prove the converse inequality. Let $u_j \to 0$ be such that

$$W_0(\overline{F}) = \lim_{j\to+\infty} E_j(u_j + \overline{F}x_\alpha, (0,1)^n).$$

By [8] Lemma 2.6 we can choose u_j 1-periodic in x_α; let v_j be defined by $v_j(x) = ju_j(x_\alpha/j, x_n)$. With fixed $j, N \in \mathbb{N}$, $(0,1)^n = \bigcup_{m=1}^N (0,1)^{n-1} \times ((m-1)/N, m/N)$; we can define a function $v_{j,m}$ by setting

$$v_{j,m}(x_\alpha, x_n) = \begin{cases} v_j(x_\alpha, x_n + \frac{2k}{N}) & \text{if } \frac{m-1}{N} - \frac{2k}{N} < x_n < \frac{m}{N} - \frac{2k}{N} \\ \\ v_j(x_\alpha, \frac{2m}{N} - x_n - \frac{2k+2}{N}) & \text{if } \frac{m-1}{N} - \frac{2k+1}{N} < x_n < \frac{m}{N} - \frac{2k+1}{N} \end{cases}$$

for $k \in \mathbb{Z}$, which is 1-periodic in x_α and $2/N$-periodic in x_n. Hence, we can construct

$$w_{j,k}{}_{|(0,1)^{n-1}\times((m-1)/N,m/N)} = v_{j,m,k}(x)$$

where $v_{j,m,k}(x) = \frac{j}{k} v_{j,m}(\frac{k}{j}x)$, such that $w_{j,k}$ is $\frac{j}{k}$-periodic in x_α and

$$w_{j,k}{}_{|(0,1)^{n-1}\times((m-1)/N,m/N)} \to \Big(0, \Big(\int_{(0,1)^n} D_n v_{j,m} dx\Big) x_n\Big) = w^m$$

as $k \to +\infty$, in $\mathrm{L}^p((0,1)^n; \mathbb{R}^m)$. In this case the functions $w_{j,k}$ defined as above belong to $\mathrm{W}^{1,p}(\Omega_k \cap (0,1)^n; \mathbb{R}^m)$.

Finally, we define w such that

$$w_{|(0,1)^{n-1}\times((m-1)/N,m/N)} = w^m$$

which is 1-periodic in x_α. Let

$$A_j^{m/N} = \Omega_j \cap \{x_n = m/N\}$$

and

$$A_k^{m/N} = \Omega_k \cap \{x_n = m/N\},$$

we define

$$E_j^N = \bigcup_{m=1}^N A_j^{m/N} \times ((m-1)/N, m/N)$$

and

$$E_k^N = \bigcup_{m=1}^{N} A_k^{m/N} \times ((m-1)/N, m/N).$$

We restrict our analysis to the case where k/j odd, the other case being dealt with by introducing a small error term. Hence, if we use the notation

$$I_l(u,(0,1)^n) = \int_{E_l^N \cap (0,1)^n} W(Du)\,dx$$

($l = j$ or k) we have that

$$I_j(v_j + \overline{F}x_\alpha,(0,1)^n) = I_k(w_{j,k} + \overline{F}x_\alpha,(0,1)^n). \tag{5.12}$$

Reasoning as in Theorems 4.11 and 4.13 we get that

$$\begin{aligned} I_{\rm hom}(w + \overline{F}x_\alpha,(0,1)^n) &= \Gamma\text{-}\lim_{k\to+\infty} I_k(w + \overline{F}x_\alpha,(0,1)^n) \\ = & \sum_{m=1}^{N} \int_{(0,1)^{n-1}\times((m-1)/N,m/N)} W_{\rm hom}(m/N, Dw + \overline{F})\,dx \\ = & \sum_{m=1}^{N} \int_{(0,1)^{n-1}\times((m-1)/N,m/N)} W_{\rm hom}\Big(\frac{[x_nN]+1}{N}, Dw + \overline{F}\Big)\,dx \\ = & \int_{(0,1)^n} W_{\rm hom}\Big(\frac{[x_nN]+1}{N}, Dw + \overline{F}\Big)\,dx \\ \geq & \int_0^1 \widetilde{W}_{\rm hom}\Big(\frac{[x_nN]+1}{N}, \overline{F}\Big)\,dx_n \end{aligned}$$

by (5.9). Taking the limit as $N \to +\infty$, we obtain

$$I_{\rm hom}(w + \overline{F}x_\alpha,(0,1)^n) \geq \overline{W}_{\rm hom}(\overline{F}) \tag{5.13}$$

by Proposition 5.2. Hence,

$$\begin{aligned} E_j(u_j + \overline{F}x_\alpha,(0,1)^n) &= \int_{\Omega_j\cap(0,1)^n} W(Dv_j + \overline{F})\,dx \\ &\geq \liminf_{k\to+\infty} I_k(w_{j,k} + \overline{F}x_\alpha,(0,1)^n) \\ &\geq \overline{W}_{\rm hom}(\overline{F}) \end{aligned}$$

by (5.11)-(5.13). By the choice of (u_j) we get the desired inequality. ☐

The proof of Theorem 5.1 will be complete once we observe that in the convex case formula (5.5) simplifies that in Theorem 4.13 (see *e.g.* [6] Section 14.3).

5.2 Convergence of minimum problems

As an application of the Γ-convergence result of the previous section, we describe the asymptotic behaviour of problems of the form

$$\begin{aligned} m_{\varepsilon,\delta} &= \min\Big\{\int_{\Omega(\varepsilon,\delta)} W(Du)\,dx : u \in \mathrm{L}^p(\omega\times(-\varepsilon,\varepsilon);\mathbb{R}^m), \\ &\qquad u_{|\Omega(\varepsilon,\delta)} \in \mathrm{W}^{1,p}(\Omega(\varepsilon,\delta);\mathbb{R}^m),\ u=\phi \text{ on } (\partial\omega)\times(-\varepsilon,\varepsilon)\Big\}, \end{aligned} \tag{5.14}$$

where $\phi = \phi(x_\alpha) \in \mathrm{W}^{1,p}(\omega;\mathbb{R}^m)$, $\Omega(\varepsilon,\delta)$ is given by (1.2) and f and W satisfy the hypotheses of Theorem 5.1. By using Poincaré's inequality it can immediately be checked that problem (5.14) admits at least one solution for each choice of $\varepsilon, \delta > 0$. The asymptotic behaviour of these solutions when $\varepsilon \to 0$ and $\delta << \varepsilon$ is given by the following result.

Proposition 5.4 *Let ε and $\delta = \delta(\varepsilon)$ satisfy the hypotheses of Theorem* 5.1, *and for each ε let u_ε be a solution of* (5.14). *Then, upon extracting a subsequence, there exist a sequence (v_ε) in $\mathrm{L}^p(\omega\times(-1,1);\mathbb{R}^m)$ and a function $w\in \mathrm{W}^{1,p}(\omega;\mathbb{R}^m)$ such that*

(i) *$v_\varepsilon = u_\varepsilon$ on $\Omega(\varepsilon,\delta(\varepsilon))$,*

(ii) *if $w_\varepsilon(x_\alpha,x_n) = v_\varepsilon(x_\alpha,\varepsilon x_n)$, then w_ε converges (with the identification $w(x)=w(x_\alpha)$) to w in $\mathrm{L}^p((\omega\times(-1,1);\mathbb{R}^m)$,*

(iii) *w is a solution of the minimum problem*

$$\widetilde{m}_0 = \min\Big\{\int_\omega 2\overline{W}_{\mathrm{hom}}(D_\alpha u)\,dx_\alpha : u\in \mathrm{L}^p(\omega;\mathbb{R}^m),\ u=\phi \text{ on } \partial\omega\Big\}, \tag{5.15}$$

where $\overline{W}_{\mathrm{hom}}$ is defined by (5.4) and (5.5),

(iv) *$m_{\varepsilon,\delta(\varepsilon)}/\varepsilon$ converges to $\widetilde{m}_0$.*

Proof. Note that, in the notation of Theorem 5.1, $\widetilde{u}_\varepsilon$ defined by $\widetilde{u}_\varepsilon(x_\alpha,x_n) = u_\varepsilon(x_\alpha,\varepsilon x_n)$ is a solution of

$$\begin{aligned} \widetilde{m}_\varepsilon &= \frac{1}{\varepsilon} m_{\varepsilon,\delta(\varepsilon)} = \min\Big\{\int_{\Omega_\varepsilon} W\Big(D_\alpha u, \frac{1}{\varepsilon}D_n u\Big)\,dx : u\in \mathrm{L}^p(\omega\times(-1,1);\mathbb{R}^m), \\ &\qquad u_{|\Omega_\varepsilon} \in \mathrm{W}^{1,p}(\Omega_\varepsilon;\mathbb{R}^m),\ u=\phi \text{ on } (\partial\omega)\times(-1,1)\Big\}. \end{aligned} \tag{5.16}$$

By [8] Remark 2.3, upon extracting a subsequence, there exist $w_\varepsilon \in \mathrm{L}^p((\omega\times(-1,1);\mathbb{R}^m)$ converging to some w in $\mathrm{L}^p((\omega\times(-1,1);\mathbb{R}^m)$, $D_n w = 0$ and $w_\varepsilon = \widetilde{u}_\varepsilon$ on Ω_ε. By the well-known property of the convergence of minima and minimizers of Γ-converging functionals (see *e.g.* [6] Theorem 7.2), (iii) and (iv) follow from Theorem 5.1, since the Γ-limit is not influenced by the boundary value ϕ (see [8] Lemma 2.6). □

Acknowledgements We gratefully acknowledge stimulating discussions with I. Fonseca, and a very careful reading of the manuscript by the anonymous referee. The research of AB was partially supported by Marie-Curie fellowship ERBFMBICT972023 of the European Union program “Training and Mobility of Researchers”, and benefitted from the hospitality of the Max-Planck Institute for Mathematics in the Sciences, Leipzig (Germany).
